- (b) suspending trading, or placing restrictions on trading certain Instruments;
- (c) cancelling some or all pending Orders;
- (d) cancelling some or all Transaction Notices sent to Members and PTSPs

during the Material Disruption; and/or

- (e) determining any price adjustment to be made in respect of Transactions formed during the Material Disruption.

11 Trading Model

11.1 Streaming Trading

- (a) 3DX facilitates Transactions based on its Streaming Trading Model between Members that have a fully disclosed pre-existing trading relationship for the purpose of concluding Transactions with one another.
- (b) Market Makers provide Quotes to 3DX on a continuous basis using an API. Any Market Taker, which has a trading relationship configured, can subscribe to receive Quotes from respective Market Makers. Market Makers can modify or withdraw their Quotes at any time during the Trading Hours.
- (c) A Market Maker can provide multiple Quotes at the same time, where each set of Quotes have different bid and ask prices with a size associated to them.
- (d) A Market Maker can define whether its Quotes can be aggregated with its other Quotes associated with different size or not, to match with the same Order.
- (e) A Market Maker can also define whether its Quotes can be aggregated with Quotes from other Market Makers or not.
- (f) A Market Taker can select from which Market Makers to receive Quotes at any given time.
- (g) A Market Taker can define the Order size (quantity), Order side (buy or sell), type of the Order (see Rule 11.2 for details), validity period (see Rule 11.3 for details), preference on partial filling as well as whether the Order to be split to allow matching with Quotes of multiple Market Makers or not.
- (h) A Market Taker can define at which price the Order shall be executed by specifying the limit/stop rate and/or Order type (see Rule 11.2 for details on supported order types).
- (i) In addition to the limit or stop price, Market Takers may define the price slippage, which determines the price range of the execution.
- (j) A Market Taker can define the time slippage for immediate-or-cancel Orders (see Rule 11.3 for details on validity periods).
- (k) A Market Taker can define the Market Maker(s) against the Quotes of which a specific Order shall be matched.

- (l) An Order is matched with Quotes on a non-discretionary basis, in particular considering best Quote price, taking the aforementioned Order and Quote parameters into consideration.
- (m) 360T requires Market Makers to respond within a defined timeframe to conclude respective Transaction(s) after any Order was matched with a Quote of the Market Maker.
- (n) No Transaction is concluded unless and until (i) the Market Maker providing the respective Quote confirms the Quote with which the Order has been matched within a Last Look timeframe specified by 3DX, and (ii) 3DX confirms that all relevant Transaction Information has been submitted together with the Market Maker's final confirmation.
- (o) Once a Transaction is concluded on 3DX, Transaction Notices are sent to both Members and, if elected by the Members, to their PTSP(s).

11.2 Order Types

- (a) A market Order is an Order placed against the Quote streams for immediate execution at best available price.
- (b) A limit Order is an Order to buy at not more or to sell at not less than the specified limit rate. The Order will be monitored against the best stream price of the selected Market Makers and will be executed when the best price reaches the defined limit. The executed price can be at level of or better than the defined limit.
- (c) A stop Order is an Order to buy or sell once the price has climbed above or dropped below the specified stop price. When the specified stop price is reached, the stop Order turns into a market Order. The executed price can therefore be worse or better than the specified stop price, if the Order is placed in a moving market. Members must choose whether they would like the stop Order to be triggered on the bid or on the ask side.
- (d) An OCO (One-cancels-the-other) is a combination of limit and a stop Order where execution of one automatically cancels the other. In case of partial fill, the size of the opposite Order is reduced accordingly.
- (e) A loop Order is a combination of buy and sell limit/stop Orders where the second Order is only active once the first Order gets executed. The number of loops can be defined by user to determine how many set of Orders to be placed in case both legs are executed.
- (f) A Time-Weighted-Average-Price (TWAP) Order is an execution algorithm that places Orders over time to minimize market impact by slicing the size of Orders which allows Market Takers to specify the frequency and minimum or maximum size of Orders to be placed.

11.3 Order Expiry Time

- (a) Immediate-or-Cancel (IOC): A market or limit Order that is to be executed fully or partially as soon as it reaches 3DX. If it cannot be executed at all, the full amount is cancelled.
